## **Background**

The present report details the findings of a visit to Central Guangdong by members of Kadoorie Farm and Botanic Garden (KFBG) in Hong Kong and their colleagues, as part of KFBG's South China Biodiversity Conservation Programme. The overall aim of the programme is to minimise the loss of forest biodiversity in the region, and the emphasis in the first phase is on gathering up-to-date information on the distribution and status of fauna and flora.

Shan	mountain
Shi	city
Tun	hamlet
Wan	bay
Xi	west
Xi, Yong	stream
Xian	county
Xiang, Cun	village

# **Report of a Rapid Biodiversity Assessment at Guanyinshan Nature Reserve, Central Guangdong, China, August 2000**

## **Objectives**

- The aims of the survey were to collect up-to-date information on the fauna and flora of Guanyinshan Nature Reserve, and to use this to help determine conservation priorities within South China.

## **Methods**

- On 10 August 2000 a team of biologists from Hong Kong (BH, ML, LKS, CW, BC, NSC), Xinyang (LHJ), Guangxi (ZSY, HJH) and Guangzhou (LS, XZ, DHJ, CZY, CBH) left Guangzhou for Guanyinshan. At 15.00 the team arrived at the Fangniudong Reservoir, south of Guanyinshan Nature Reserve. They stayed at Fogang County Town.
- During fieldwork visual searching for plants, mammals, birds, reptiles, amphibians, fish, ants, butterflies and dragonflies was conducted. Frogs and birds were also identified by their calls. Plant records were made by field observation, with some specimens collected.
- Vascular plant records were made by CBH, CZY or NSC, and edited by NSC, except for orchids, for which records were made by CBH and ML, and verified by GS. No direct mammal records were made. Records of birds were made or verified by LKS or CW, reptiles and amphibians by ML or BC, fish by BC, DHJ or CXL, dragonflies by ML, KW or GTR and butterflies by ML or GTR.
- Nomenclature in the report is standardised based, unless otherwise stated, on the following references:
  - Flora (Pteridophyta, Gymnospermae and Angiospermae excluding Orchidaceae): Anon. (1959-2001); Anon. (1996-2001); Anon. (2002a, 2002b); The Plant Names Project (2002);
  - Orchids (Angiospermae: Orchidaceae): Chen (1999); Lang (1999);
  - Mammals (Mammalia): Wilson & Cole (2000);
  - Birds (Aves): Inskipp *et al.* (1996);
  - Reptiles and Amphibians (Reptilia and Amphibia): Zhao E.-M. & Adler (1993); Zhao E. *et al.* (2000);
  - Fish (Actinopterygii): Nelson (1994); Wu *et al.* (1999);
  - Dragonflies (Insecta: Odonata): Schorr *et al.* (2001a, 2001b);
  - Butterflies (Insecta: Lepidoptera): Bascombe (1995).
- Information on the global status of species is from IUCN publications, notably IUCN (2002). Certain taxa, including orchids, reptiles, amphibians, fish and invertebrates, have yet to be properly assessed for global status. National conservation status of orchids is based on Wang *et al.* (in press).
- Protected status in China is based on Hua & Yan (1993) for animals, and State Forestry Administration & Ministry of Agriculture (1999) for plants.

## **Location and management**

- Guanyinshan Nature Reserve is situated in central Guangdong at 23° 57'N, 113° 32'E, in the northwest of Fogang County, Qingyuan City District, on the border with Yingde City. The size of the reserve is 28 km<sup>2</sup> (MacKinnon *et al.*, 1996; Zhang, J., 1997; Zhang W., 1998).
- The geology is mainly granite. The reserve has a mountainous landscape, and over ten peaks above 900 m within its small area. Altitude in the reserve ranges from below 350 m to 1,219m at the summit of Yapozi (Zhang J., 1997).
- The region as a whole has a subtropical monsoon climate with a mean annual temperature of 21°C. Mean monthly temperature ranges from 8°C in January to 28°C in July; annual

precipitation is about 2,200 mm and occurs mainly between April and September. The streams radiate in different directions, all eventually feeding into the Bei Jiang of the Zhujiang system.

- Guanyinshan was designated a provincial nature reserve in November 1985 by the Guangdong Provincial Government. The reserve was established to protect the subtropical evergreen broadleaf forest and rare flora and fauna (Zhang J., 1997).

## Results

### Vegetation

- The vegetation of Guanyinshan Nature Reserve has been reported to include the following types (Zhang J., 1997):
  - i) Subtropical monsoon evergreen broadleaf forest, the zonal vegetation of the region, at medium altitude;
  - ii) Montane evergreen broadleaf forest, between medium and high altitude;
  - iii) Young secondary forest of *Pinus massoniana*, mainly below high altitude. This vegetation had recently regenerated from deforested sites;
  - iv) Mixed evergreen broadleaf and coniferous forest, between medium and high altitude at the margin of evergreen broadleaf forest;
  - v) Montane evergreen dwarf forest, above higher altitude near ridges and summits.
- The present rapid survey was able to visit only the southern parts of the reserve. The surveyed area was covered mainly in young secondary broadleaf forest dominated by *Liquidambar formosana* and *Schefflera octophylla*, about 4-8 m tall and less than 30 cm dbh, and young open *Pinus massoniana* plantation about 2-4 m tall. More mature secondary broadleaf forest about 10-15 m tall and 40 cm dbh was found in small patches near Baisha Keng village, but the age of the forest was reported to be less than 40 years.

### Flora

- The present survey recorded 538 vascular plant species including 51 fern species in 23 families, four gymnosperms in four families, and 483 angiosperms in 106 families (Table 1). This is a very high number given the two-and-a-half days of field work, but includes many species of degraded vegetation and of fairly low conservation significance. Earlier surveys of Guanyinshan had recorded 1,163 vascular plant species (Zhang, J., 1997).
- Among the flora recorded in the present survey, some are of conservation concern:
  - The orchid *Habenaria leptoloba* is a new record for Guangdong. It was considered endemic to Hong Kong (Siu, 2000) before the present survey, and is known only from these two sites.
  - *Cymbidium ensifolium* is Endangered in China due to over-collection for ornamental purposes.
  - *Diplopanax stachyanthus* is globally Vulnerable and is mainly found in relatively good hillside broadleaf forest in South China.
  - *Ixonanthes chinense* and *Artocarpus hypargyreus* are considered Vulnerable, although both are widespread and fairly common in South China.
  - *Castanopsis kawakamii* is considered to be at Lower Risk (near threatened). It is widespread in South China and occasionally dominant in hillside broadleaf forest.
  - *Alsophila spinulosa* and *Gymnosphaera podophylla* are tree fern species, all of which are under Class II National Protection in China, and are usually restricted to relatively mature forest.
  - *Cibotium barometz* and *Brainea insignis* are under Class II National Protection in China although they are both widespread in South China and common in degraded secondary forest.
  - *Toona ciliata* is under Class II National Protection in China. It is widespread in broadleaf forest of South China.
  - *Eurycorymbus cavaleriei* is under Class II National Protection in China and is considered to be at Lower Risk (near threatened) globally.

- *Cinnamomum camphora* is under Class II National Protection in China, although it is widespread and commonly cultivated in South China.
- *Blastus pauciflorus* is endemic to Guangdong and Jiangxi.
- *Ormosia pachycarpa* var. *tenuis* is endemic to Guangdong.
- All the orchid species recorded are listed in CITES Appendix II.

**Table 1.** Vascular plants of Guanyinshan Nature Reserve recorded in the present survey. Species which are nationally Protected (Class I or II) (State Forestry Administration & Ministry of Agriculture, 1999), globally Threatened or Lower Risk (Near-threatened) (IUCN, 2002) or globally restricted are indicated.

### Mammals

- A medium-sized carnivore scat, probably from a Small Indian Civet *Viverricula indica*, was found on 11 August.
- At the time of writing no records were available on the mammal fauna of Guanyinshan. Some of the species previously recorded from Yingde City, such as Indochinese Shrew

*Crocidura attenuata*, Rhesus Monkey *Macaca mulatta*, Asiatic Black Bear *Ursus thibetanus* (recorded as *Selenarctos thibetanus*), Sika Deer *Cervus nippon*, Indian Muntjak *Muntiacus muntjak*, Reeves's Muntjac *Muntiacus reevesi*, Chinese Goral *Naemorhedus caudatus* (recorded as *N. goral*) and Chinese Pangolin *Manis pentadactyla* (Zhang Y. et al., 1997 and references therein) may have occurred at Guanyinshan, but more specific and up-to-date information is required.

### Birds

- Twenty-eight bird species were recorded at Guanyinshan (Table 2). Both abundance and richness were rather low.
- The most frequently encountered species included Chestnut Bulbul *Hemixos castanonotus*, Grey-cheeked Fulvetta *Alcippe morrisonia* and Red-rumped Swallow *Hirundo daurica*.

**Table 2.** Birds recorded at Guanyinshan Nature Reserve, 10-12 August 2000. Sequence follows Clements (2000).

Scientific name	English name
<i>Aviceda leuphotes</i>	Black Baza
<i>Spilornis cheela</i>	Crested Serpent Eagle
<i>Falco peregrinus</i>	Peregrine Falcon
<i>Centropus sinensis</i>	Greater Coucal
<i>Megalaima oorti</i>	Black-browed Barbet
<i>Picumnus innominatus</i>	Speckled Piculet
<i>Blythipicus pyrrhotis</i>	Bay Woodpecker
<i>Hirundo daurica</i>	Red-rumped Swallow
<i>Pericrocotus solaris</i>	Grey-chinned Minivet
<i>Pycnonotus jocosus</i>	Red-whiskered Bulbul
<i>Hemixos castanonotus</i>	Chestnut Bulbul
<i>Hypsipetes mcclellandii</i>	Mountain Bulbul
<i>Hypsipetes leucocephalus</i>	Black Bulbul
<i>Myophonus caeruleus</i>	Blue Whistling Thrush
<i>Prinia atrogularis</i>	Hill Prinia
<i>Orthotomus sutorius</i>	Common Tailorbird
<i>Phylloscopus ricketti</i> *	Sulphur-breasted Warbler
<i>Enicurus scouleri</i>	Little Forktail
<i>Enicurus leschenaulti</i>	White-crowned Forktail
<i>Pomatorhinus ruficollis</i>	Streak-breasted Scimitar Babbler
<i>Pnoepyga pusilla</i>	Pygmy Wren Babbler
<i>Stachyris ruficeps</i>	Rufous-capped Babbler
<i>Alcippe morrisonia</i>	Grey-cheeked Fulvetta
<i>Yuhina castaniceps</i>	Striated Yuhina
<i>Parus major</i>	Great Tit
<i>Aethopyga christinae</i>	Fork-tailed Sunbird
<i>Zosterops japonicus</i>	Japanese White-eye
<i>Lanius schach</i>	Long-tailed Shrike

\* Identity in question, as taxonomy has recently been revised (P.J. Leader, Hong Kong, pers. comm., February 2003).

- Black Baza *Aviceda leuphotes*, Crested Serpent Eagle *Spilornis cheela*, Peregrine Falcon *Falco peregrinus* and Greater Coucal *Centropus sinensis* are Class II Protected in China.
- The presence of forest-dependent birds (including a barbet, woodpeckers, bulbul and babblers) indicates quite intact forest habitat in the vicinity.

### Reptiles and Amphibians

- Four species of amphibian and seven species of reptile (three lizards and four snakes) were recorded during the survey (Table 3). No reptiles or amphibians were found on 12 August.
- One lizard species could not be firmly identified and is provisionally assigned to *Platyplacopus kuehnei*.
- The most frequently encountered species was *Rana limnocharis*.

**Table 3.** Amphibians and reptiles recorded in Guanyinshan Nature Reserve from 10 to 12 August 2000. Sequence follows Zhao E.-M. & Adler (1993).

Species	Habitat	
<b>AMPHIBIA</b>		
<i>Rana limnocharis</i>	reservoir edge	✓
	paddy field	tadpoles
	marsh	✓
	pool	tadpoles
<i>Polypedates megacephalus</i>	pool	tadpoles
<i>Microhyla heymonsi</i>	pool	tadpoles
<i>Microhyla pulchra</i>	paddy field	tadpoles
	pool	tadpoles
<b>REPTILIA</b>		
<i>Calotes versicolor</i>	shrubland/plantation	✓
	shrubland	✓
<i>Platyplacopus</i> (cf. <i>kuehnei</i> ) sp.	plantation edge	✓
<i>Sphenomorphus incognitus</i>	stream	✓
<i>Psammodynastes pulverulentus</i>	tall shrubland	✓
	forest	✓
<i>Ptyas korros</i>	marsh	✓
<i>Sinonatrix percarinata</i>	stream	✓
	forest ditch	✓
<i>Ophiophagus hannah</i>	forest	✓

- The sites covered did not have much mature forest; hence the lack of forest specialists in this survey.

#### Fish

- Ten freshwater fish species were recorded from Guanyinshan Nature Reserve and Fangniudong Reservoir (Table 4).
- The most frequently encountered species recorded in the nature reserve were *Acrossocheilus parallens* and *Rhinogobius duospilus*, while *Zacco platypus* and *Rhinogobius giurinus* were most abundant in Fangniudong Reservoir.
- The reservoir visited appeared to have a different fish community to the streams.
- The stream catfish *Pterocryptis* sp. is a new species for science. A specimen from Guanyinshan, collected on 11 August, has been assigned as a paratype (Ng & Chan, in preparation).

**Table 4.** Freshwater fish recorded from Guanyinshan Nature Reserve, Guangdong, 10-12 August 2000 ("\*" = nomenclature follows Pan, 1991). Sequence of families follows Nelson (1994).

Species
<i>Zacco platypus</i>
<i>Hemiculter leucisculus</i> *
<i>Acrossocheilus parallens</i>
<i>Oreoneutes platycephalus</i>
<i>Vanmanenia pingchowensis</i>
<i>Pseudogastromyzon fangi</i>
<i>Pseudogastromyzon changtingensis tungpeiensis</i>
<i>Pterocryptis</i> sp.
<i>Rhinogobius duospilus</i>
<i>Rhinogobius giurinus</i>

- Fish diversity and abundance at Guanyinshan were rather low and the fish fauna was of low conservation interest except for the new-to-science *Pterocryptis* sp.

### **Dragonflies**

- Only 29 species were recorded during the three-day survey (Table 5). One of these (*Vestalis* sp.) remains unidentified.

**Table 5.** Dragonflies at Guanyinshan, 10-12 August 2000. Sequence of families follows Schorr et al. (2001a, 2001b).

<b>Species</b>
<i>Archineura incarnata</i>
<i>Calopteryx melli</i>
<i>Matrona basilaris</i>
<i>Vestalis</i> sp.
<i>Rhinocypha drusila</i>
<i>Euphaea decorata</i>
<i>Coeliccia cyanomelas</i>
<i>Prodasineura autumnalis</i>
<i>Chlorogomphus papilio</i>
<i>Epophthalmia elegans</i>
<i>Macromia calliope</i>
<i>Macromia malleifera</i>
<i>Heterogomphus retroflexus</i>
<i>Lamelligomphus camelus</i>
<i>Melligomphus sommeri</i>
<i>Brachythemis contaminata</i>
<i>Crocothemis servilia</i>
<i>Onychothemis testaceum tonkinensis</i>
<i>Orthetrum glaucum</i>
<i>Orthetrum luzonicum</i>
<i>Orthetrum pruinatum</i>
<i>Orthetrum sabina</i>
<i>Palpopleura sexmaculata</i>
<i>Pantala flavescens</i>
<i>Pseudothemis zonata</i>
<i>Sympetrum parvulum</i>
<i>Tramea virginia</i>
<i>Trithemis aurora</i>
<i>Trithemis festiva</i>

- The presence of four calopterygids and two *Macromia* species indicates that streams in the study area were of high water quality.

### **Butterflies**

- Forty-five species were recorded during the three-day survey (Table 6). These included two species (*Aeromachus* sp. and a papilionid) which are currently unidentified.

**Table 6.** Butterflies at Guanyinshan, 10-12 August 2000. Species abundance data were not collected. Sequence of families follows Bascombe (1995).

<b>Species</b>
<i>Aeromachus</i> sp.
<i>Astictopterus jama</i>
<i>Bibasis oedipodea</i>
<i>Hasora vitta</i>
<i>Iambrix salsala</i>
<i>Parnara guttata</i>
<i>Graphium sarpedon</i>
<i>Papilio bianor</i>
<i>Papilio helenus</i>
<i>Papilio memnon</i>
<i>Papilio paris</i>
<i>Papilio polytes</i>
<i>Papilio protenor</i>
unidentified papilionid
<i>Eurema blanda</i>
<i>Eurema hecabe</i>
<i>Hebomoia glaucippe</i>

<b>Species</b>
<i>Leptosia nina</i>
<i>Pieris candida</i>
<i>Abisara echerius</i>
<i>Acytolepis puspa</i>
<i>Horaga onyx</i>
<i>Taraka hamada</i>
<i>Apatura (Rohana) parisatis</i>
<i>Athyra perius</i>
<i>Euploea core</i>
<i>Euploea midamus</i>
<i>Ideopsis similis</i>
<i>Lethe confusa</i>
<i>Mandarinia regalis</i>
<i>Mycalesis minues</i>
<i>Mycalesis zonata</i>
<i>Neope muirheadii</i>
<i>Neptis clinia</i>
<i>Neptis hylas</i>
<i>Parantica aglea</i>
<i>Parathyma sulpitia</i>
<i>Penthema adelma</i>
<i>Polygonia (Kaniska) canace</i>
<i>Precis (Junonia) almana</i>
<i>Precis (Junonia) orithya</i>
<i>Stibochiona nicea</i>
<i>Symbrenthia lilaea</i>
<i>Ypthima baldus</i>
<i>Ypthima lisandra</i>

- The two unidentified species are of potential conservation interest.
- Of the species recorded, some (e.g. *Hasora vitta*, *Iambrix salsala*, *Horaga onyx*, *Mandarinia regalis*, *Neope muirheadii*, *Penthema adelma* and *Stibochiona nicea*) are typical of forest habitat.

### Summary of flora and fauna

- The present survey covered only the southern buffer zone of Guanyinshan Nature Reserve. The surveyed area was found to be mainly young secondary broadleaf forest about 4-15 m in height. Older broadleaf forest less than 40 years old was found in more inaccessible ravines. There was reportedly more mature forest within two days walk of one of the hills; access was difficult due to a lack of trails.
- The present survey recorded 538 vascular plant species, a rather high figure, but the composition was typical of degraded vegetation. The orchid *Habenaria leptoloba* was previously known only from Hong Kong, and now has only two known sites. The recorded flora included nine globally Threatened or nationally Protected species and one Near-threatened species. Two globally restricted species were found in the present survey.
- Rather few vertebrate species were recorded during the survey: 28 birds, four amphibians, seven reptiles and ten fish. Four of the birds recorded are nationally Protected.
- Twenty-nine dragonfly and 45 butterfly species were recorded. One dragonfly and two butterflies have yet to be identified. Several dragonfly species found are dependent on clean water.
- MacKinnon *et al.* (1996) suggested re-evaluating Guanyinshan Nature Reserve, implying it was too small and degraded to be of biodiversity importance. Degradation is rather severe, but since the site was found to support some species of conservation concern it is here considered of local importance.

### **Threats and problems**

- Much of the natural vegetation has been damaged at Guanyinshan, and it is likely that much biodiversity has been lost. The young secondary forest was very dry at the time of our visit (during the summer wet season), and fire could be a risk to the regenerating vegetation.
- Tourism was evidently being promoted through the usual attractions such as karaoke, and the stream had been dammed to make a swimming pool. There was no evidence that either nature conservation or environmental education were primary management objectives.

### **Opportunities**

- If the regenerating habitats are carefully protected from fire, logging, hunting, grazing and other unsuitable activities, there is potential for natural forest to re-establish itself in future decades.
- Tourist facilities at Guanyinshan (e.g. Guanyin Villas) provide a good opportunity for promoting environmental awareness among the general public.
- A lot of the hillsides are now covered with degraded young forest and shrubland, and here forest regeneration could be accelerated by planting native trees. Priority might be given to linking up more mature forest patches to establish contiguous forests spanning the altitudinal range of the reserve. To achieve this, there is probably a need to establish a tree nursery to produce seedlings. Advice could be sought from regional centres of expertise (such as South China Agricultural University, The University of Hong Kong and KFBG) regarding reforestation techniques and in managing native tree nurseries.

### **Acknowledgements**

The editors wish to thank the Guangdong Forestry Department for their cooperation and assistance, and all participants of the survey team, including field staff at Guanyinshan Nature Reserve. We also thank our volunteers, Ms. Karen Chan and Ms. Vicky Yeung, for data input. This work has been funded by KFBG.
